

DSA is not the only way to get in to companies like Google, Microsoft, Walmart.

You've probably heard this a hundred times:

If you want MAANG, you must master DSA.

But the truth is companies don't just need people who solve algorithms. They need people who can build, test, manage, and improve products.

Here are some roles you can explore that don't require heavy DSA:

① QA / Test Automation

Learn automation tools and testing fundamentals, build small projects, document your tests, and explore CI/CD so that you can make sure software works reliably.

② Product Management / Business Analyst

Gather requirements, create mockups and dashboards, track metrics, document clearly, and keep learning so you can build products that really solve user problems

③ DevOps / Cloud Engineer

Learn Linux, scripting, cloud platforms, CI/CD, and deployment pipelines so you can automate, scale, and keep software systems running smoothly.

④ Project Management / Tech PM

Plan projects, manage tasks, follow Agile or Scrum, and communicate clearly so that you can track progress and deliver projects on time while keeping your team coordinated.

DSA is helpful, but it is not the only way to land a job in MAANG.

Find the roles that match your strengths,

Whether it is QA, DevOps, PM, or Product,

Remember, consistent effort and curiosity will take you further than just memorizing algorithms.
